

BACK END DEVELOPER

- A backend developer is responsible for building and maintaining servers, databases, and APIs, ensuring efficient data processing and secure communication with the frontend.
- It requires strong skills in server-side development, databases, APIs, and various tools for smooth application functioning, focusing on server logic, database interactions, security, and performance.

- Key Responsibilities:

1. Server-Side Logic:

- e.g. when users log in, upload data, or access content.

2. Database Management:

For SQL: PostgreSQL or NoSQL options like MongoDB, Cassandra.
